AUGUST 2004

“Instruments of measuring efficiency of human resources in selected manufacturing organization in Nigeria,” is a research topic, chosen as a result of the effects of the present economic situation in Nigeria, which has affected all sectors of our economy. The study identified some of our economic problems as highlighted by economic experts as being that of inflation, deflation, stagflation or recession. The economic problems have led to the problem of dwindling profits and turnovers, inefficiency in the use of scarce resources, low productivity and negative attitude to work by employees. The review of related literature on the topic and subsequently the application of appropriate research design, helped in the evaluation of various instruments of measuring efficiency which are most appropriate for the training and management of our human resources.
